EcoClaim Process: What is required

EcoClaim®
Training | Software | Exchange

SORT
To streamline the diversion process, sort materials on-site during the demolition phase. This approach works if you sort as you demo similar type materials.

TRACK
Once you have weighed the materials that have been removed, it's important to accurately track the weight using the EcoClaim Trax software. This software can help in maintaining a precise record, which is crucial for both environmental accountability and client reporting.

DEMO/REMOVE
First, determine whether materials can be dried and restored instead of replaced. Once your team has either attempted drying or identified the need for removal, initiate the demolition phase.

WEIGH
Incorporate weighing each 'full bag' or 'full unit' into your demolition process. The sooner you adopt this practice, the easier and more habitual it will become. This step is essential for assisting clients in reporting their emissions.

DIVERT
Transport the debris to either your facility or directly to the recycler/vendor. This information also needs to be entered into the Trax software, therefore partnerships and processes should be set up beforehand.
